

Overview

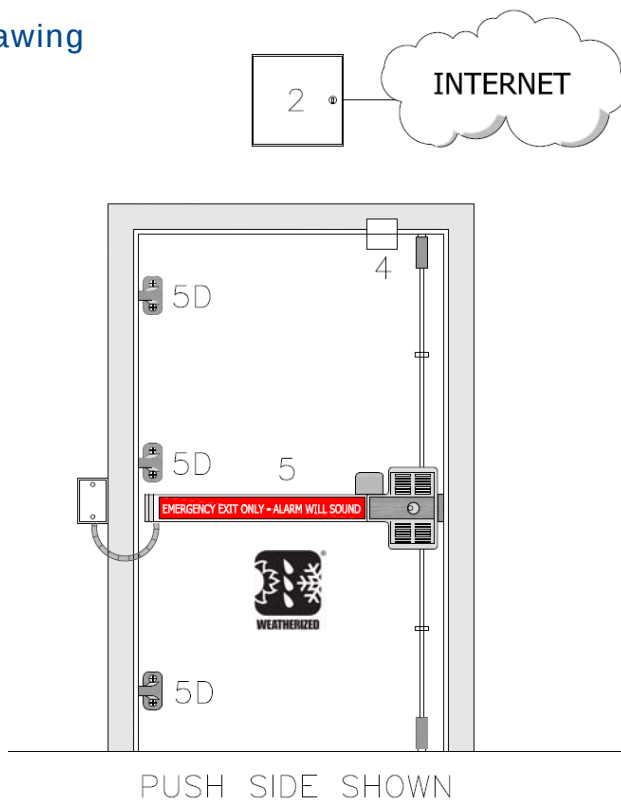

This K.M. Thomas electronic locking system provides code compliance, while securing single exterior doors with stainless steel bolts at six locations on each door. Higher levels of security are a requirement on Marijuana or other indoor crop growing facilities. Our unique packaged solution is designed to operate in the wet environments, like those found in greenhouses. Internal and external loss prevention are both addressed with the TA-MSDT3-KIT. When properly installed our system provides up to 16,000 LB holding force to prevent exterior attack. This system is designed for installation on doors that are intended for emergency exit only.

The products contained in this kit are simple to install, configure and use, and include complete detailed instructions for the entire system. The system can be easily monitored through the internet by the owner as an optional, additional service.

Operation

- Door is normally closed and secured at 6 points, and the alarmed exit device is armed.
- Alarmed exit device can be unlocked/disarmed by use of key from inside only. Exit device must be rearmed with key from inside.
- There is no access from the exterior side.
- Emergency exit is always free by pushing on exit device, which will cause the local alarm to sound, and remotely alert the owner if internet connection is active and subscription service option has been activated.
- During main power failure the system will continue to function for a limited time on battery power.
